FULL CATALOGUE REPORT

Orby Book 1

28 September 2026 · Goffs · 482 lots

Every lot rated · 10 hot picks · shortlists by band · full stats on each lot

PREPARED FOR

Bloodstock agents and buying teams

ISSUED

17 September 2026

DATA AS AT

17 September 2026, 11:21. EQS is updated daily; re-run to refresh.

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

Contents

01 Executive summary
The book in one page, and what the lists found.

02 How the ratings are built
The index, the bands, the value screen and the hot picks, each defined.

03 Sale profile
This sale's own results, year by year.

04 Sire landscape
The sires best represented in the catalogue, read against the database.

05 Sire and damsire crosses
0 of 482 lots have a cross carrying enough evidence to rate.

06 Reading a lot entry
Every field on a lot entry, numbered and explained.

07 EQS Hot Picks - the 10
High merit, low price markers. Full entries for each.

08 Shortlist - Premium
25 lots in this band; the 25 highest rated listed.

09 Shortlist - Strong
72 lots in this band; the 25 highest rated listed.

10 Shortlist - Solid
144 lots in this band; the 25 highest rated listed.

11 Shortlist - Watching
241 lots in this band; the 25 highest rated listed.

12 What the database holds
Coverage behind every figure, and how to read a blank cell.

13 Catalogue analysis
All 482 lots, every measure, one row each, in lot order.

14 Full lot entries
All 482 lots, one entry each: family record, sire, damsire, trade.

15 Method and limitations
What the numbers are and what they are not.

SAMPLE

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

Executive summary

This report rates every one of the 482 lots catalogued for Orby Book 1 on 28 September 2026. Store horses and yearlings are unraced, so an agent's judgement rests almost entirely on the page: what the dam did, what she has produced, what the sire gets, and what the family has traded for. Those four things are what the EQS Prospect Index measures, and every lot in the book carries a full entry at the back of this document.

The book is concentrated at the top and thin below it. 8 sires supply 30% of the catalogue, and 204 of the 482 lots have no black type performer anywhere on the dam's recorded produce. Two separate readings sit alongside the index: 0 value picks, where an unproven first generation hides a proven second, and 10 hot picks, where the page rates well above everything the ring can see to price it on.

482	€100,000	10	0
LOTS RATED	MEDIAN 2025	HOT PICKS	VALUE PICKS

What the lists found

- **Lot 359 (Sea The Stars × Ambivalent)** rates highest in the catalogue at 96/100. Dam 9 black type; 4 of 14 produce records held have black type, and the sire returns 40.0% of 1,725 progeny, 89th percentile. Page, sire and family trade all sit above the catalogue median, and it will be bid accordingly.
- **Lot 244 (Phoenix Of Spain × Scala Romana) heads the hot picks** on a 87-point gap: 99th percentile in the book on page and sire, 12th on the markers the ring prices off. The sire averages EUR 28,804 at auction; the family's best lot made EUR 50,000.

SAMPLE

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

How the ratings are built

Three separate readings of the same catalogue. The index ranks every lot on the page. The value screen looks one generation further back. The hot picks compare what a lot is bred to be against what the ring can see to price it on. They answer different questions and they do not always agree.

The index - three components

Page strength - 45 points
The dam's own black type record, the share of her recorded produce that has secured black type, and the earnings of her best performer.

Sire strength - 30 points
The share of a sire's recorded progeny that have secured black type, as a percentile against every sire with 30 or more progeny on record. A sire below that threshold is not rated, and scores a neutral 9 rather than being penalised for a small sample.

Market signal - 25 points
The highest auction price achieved by the dam's other produce, on a log scale so a single outlier cannot dominate. A lot with no recorded family trade scores a neutral 8: absence of a record is not evidence of a poor family.

Reading the bands

BAND	POSITION IN CATALOGUE	LOTS
PREMIUM	Top 5%	25
STRONG	Next 15%	72
SOLID	Next 30%	144
WATCHING	Bottom 50%	241
HOT	Cross-cutting	10

Bands are relative to this catalogue, not an absolute standard. The index measures the page, not the horse: conformation, movement, veterinary status and the walk are not in the data.

The EQS Hot Picks - high potential at a good price

A hot pick is a lot rated well above what the ring can see to price it on. It needs two measures that do not contain each other, or the screen cancels itself out - so merit deliberately excludes the index's market signal component, because market signal is itself a price.

MERIT - WHAT IT IS BRED TO BE

Page strength plus sire strength, the 75 index points that measure racing and production record. Converted to a percentile within this catalogue. The market signal component is excluded.

PRICE MARKERS - WHAT IT WILL COST

What a bidder can see and price off: how commercial the sire is (50%), what the family has traded for (30%), and the dam's own auction average (20%). Also a within-catalogue percentile.

The score is the gap between the two. A lot in the 60th percentile on merit and the 20th on price markers scores 40. The floor matters: without it the cheapest rubbish in the sale wins, because nothing is more underpriced than something worthless. So a hot pick must sit at or above the 60th percentile on merit and show a gap of at least 20 points. In this catalogue 101 lots qualified and the 10 widest gaps were kept, cutting at 67.

This is a screening idea, not a valuation. It says a lot is cheaper on paper than it is bred to be. It cannot see the horse, and a lot can be cheap on the page for a reason the data does not hold - a physical fault, a veterinary history, a consignor's reputation.

SAMPLE

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

Sire landscape - the best represented sires

The black type rate is the share of a sire's recorded progeny that have secured black type at least once. Across all sires with 30 or more progeny the median rate is 27.0%, so the figures below should be read against that benchmark rather than in isolation. Rates are not age-adjusted: a sire whose stock is still young will understate.

SIRE	LOT	RECORDED PROGENY	BLACK TYPE RATE	PERCENTILE	AVG SALE	MEDIAN IDX

The full sire landscape is in the paid report

Average sale price is the database-wide figure for the sire, in euro, across all auctions. Median index is for that sire's lots in this catalogue only.

What the sire table is telling you

- **Volume and quality are not aligned.** No Nay Never supplies the most lots of any sire in the book at 24, and returns 29.0% from 1,486 recorded progeny - the 55th percentile.
- **Where the hot picks come from.** Of the best represented sires, Wootton Bassett averages €118,208 at auction and Dark Angel averages €38,055. A lot with a strong page by the second is the shape the hot pick screen looks for - comparable merit, a fraction of the reputation. Averages are database-wide for the sire and are not this sale's prices.

SAMPLE

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

Reading a lot entry

Every lot in this report is set out the same way. The numbers below point at each part of an entry and say what it is, where it comes from, and how to read it.

1 Lot number
As printed in the auction house's own catalogue. It is a live link: it opens that lot's page on the vendor's site.

2 The index score
The EQS Prospect Index out of 100 - page strength 45, sire strength 30, market signal 25. It measures the page, not the horse.

3 Band and flags
Premium, Strong, Solid and Watching are positions within THIS catalogue, not an absolute standard. HOT and VALUE are separate flags and can land on a lot in any band.

4 Identity
Sex, year foaled, country of foaling, consignor, damsire and the sire's own sire.

5 The dam
FOALS is the count on her rollup. RECORDS HELD is how many produce EQS actually holds and how many of those have black type - the two differ and both are shown rather than the larger. HER OWN BT is her own record on the track. AVG SALE is what her produce have averaged at auction. DAMSIRE and GRANDSIRE are percentiles among rated sires.

6 The sire
PROGENY is his recorded stock and BLACK TYPE the share of it that has secured black type, with PERCENTILE placing that among sires with 30 or more progeny. WNRS/RNRS is how many of the stock that reached a racecourse won at least once; WINS/RUNS is how many of all the races they contested they won. Read both: a sire can get many winners who each win once, or few who win repeatedly.

7 Family black type record
The dam's best produce by black type and earnings, each with its peak OR and the trips it won over. A blank rating means EQS holds none for that horse, never that the horse was unrated.

8 Previous family sales
What this family has actually traded for at auction, highest first.

9 Foals (OR)
EVERY foal of the first dam with her OR in brackets, best first. A dash means no rating is held - most often an unraced or very young horse. It is never printed as a nought, because nought is a rating a horse can genuinely be given.

10 Runners
Only the produce that carry a rating, with every distance each one won over. A shorter list than the foals above is normal: the difference is the foals that have not raced.

11 Sire and dam sire cross
Foals by this sire out of mares by this damsire - how many, how many have black type, and their winners to runners. Where the cross reaches 30 foals it also carries an index against what the two sides separately predict. Below that it is reported as a count and not a rate, because a rate from a handful of foals describes the sample rather than the cross.

12 Footer
Rank within the catalogue, the three index components, and where the lot sits on merit against the price markers. On a sale already run, the result replaces the family's best trade.

SAMPLE

SAMPLE EXTRACT - not the full report. Every lot in this book is rated in the paid edition.

EQS Hot Picks - the 10

Lots rated well above what the ring can see to price them on. Ranked by the gap between merit - page and sire strength, as a percentile within this catalogue - and the price markers a bidder can read off the page. These are not the best lots in the sale; they are the lots whose price is most likely to understate them.

#	LOT	SIRE × DAM	CONSIGNOR	MERIT	PRICE	GAP	INDEX	BAND	SIRE AVG SALE
[illegible]									

The hot picks are listed in full in the paid report

MERIT and PRICE are percentile ranks within this catalogue. GAP is the difference. A lot at the 85th on merit and the 20th on price markers shows a gap of 65.

Method, data and limitations

Computed from the EQS data layer at 17/09/2026 11:21. Sources: gold_fact_sales_upcoming for the catalogue, gold_summary_sire and gold_summary_dam for the rollups, gold_horse_summary for individual records, and gold_fact_sales for auction results and the sale history.

Nothing in this report is estimated

Every figure is read from the EQS database. No value is imputed, averaged in, carried across from a related field, or inferred. Where the database holds no record the report is blank and says so, and a blank is never zero. Two scoring conventions are the exception and are labelled wherever they appear: an unrated sire scores 9 of 30 on sire strength and a lot with no recorded family trade scores 8 of 25 on market signal, so that neither is penalised for absent data.

The database is updated daily

Upcoming and completed sales both load on a daily cycle, and sale results are added as they are published. A lot showing no result has either not sold yet or has not yet loaded. The data-as-at time is on the cover.

Winners to runners, and wins to runs

Two separate readings of the same stock, printed side by side because either alone misleads. Winners to runners is the share of a sire's runners that won at least once - how many of his stock are any good. Wins to runs is the share of all races they contested that they won - how often they win when they turn up. A sire can rate well on one and poorly on the other, and the pair is what tells them apart. Both are counted from gold_fact_racing, one row per horse per run.

A win is a finishing position of one

Nothing else. It is not derived from the summary rollup, because the black type figure there counts black type PERFORMANCES, which include placings - adding it to the win count would record a Group 3 third as a win. Where EQS holds no race record for a sire's stock the figures are blank rather than zero.

The cross is shown with its sample size, always

Every cross prints its recorded foals, its black type count and its winners to runners, however small it is. Only a cross with 30 or more recorded foals is given an index, and one below that carries a line saying so in as many words. The reason is arithmetic rather than caution: black type is a rare event, so at a base rate near the population rate a cell of twenty foals expects about one black type horse, and nought or three are both entirely ordinary. A rate from a cell that size describes the sample, not the cross.

Rating and the distances won over

For each of the first dam's runners the report prints the highest Official Rating EQS holds for that horse, marked OR, followed by EVERY distance it has won over, shortest first. A horse that won at six furlongs and again at a mile shows both, because one figure would hide what its record is telling you. Distances are those of winning runs only - never an average, and never the trip it ran over most often, either of which would describe a horse that does not exist. 'No win recorded' means the horse is rated but has not won. A runner absent altogether means EQS holds no rating for it, most often because it has not run, and never that it was unrated. Where an Official Rating is not held for a horse the Racing Post Rating is shown in its place and marked RPR, so the two are never read as the same measure.

Recorded progeny is a coverage figure, not a foal count

It counts the offspring EQS holds a record for, not everything a stallion got. A sire's true book is larger, and by how much depends on how well his region and era are covered. It is the denominator of the black type rate, which is why sires below 30 recorded progeny are not rated at all.

Black type secured

A recorded win or placing in a pattern or listed race, as classified by EQS. Counted as occasions, so one horse placing twice counts twice; the number of individual black type foals is shown separately.

Produce records are a floor, not a total

A dam's foals that never raced and never went through a covered auction may not appear. A thin record is not proof of a thin family, and the value screen exists partly because of this.

Rates are not age-adjusted

A sire whose stock is still young will understate. Sires with fewer than 30 recorded progeny are scored neutral rather than penalised, and the proven test used by the value screen is set higher again at 80.
